Is All News Bad News For Bonds? Will CPI Matter?

MBS Recap Matthew Graham | 5:05 PM

At times these day, it may seem like all news is bad news for bonds. Higher tariffs hurt us in mid April, and lower tariffs are hurting us now. There are reasons for the paradox. Higher tariffs initially helped quite a bit, but overly high tariffs caused a liquidation that hurt both sides of the market. The 90 day US/China pause announced this morning leaves tariffs high enough to put upward pressure on rates via the inflation channel, and low enough to rob rates of the bullish impulse from the recession channel. The lack of finality means we're waiting months and months before accurately understanding the impacts, and the big bounce in stocks suggests there's room to unwind previous "risk-off" trades in the meantime.

Market Movement Recap

- 11:14 AM sharply weaker overnight, but erasing some losses now. MBS still down 6 ticks (.19) and 10yr down 5.6bps at 4.441
- 02:11 PM drifting back to weakest levels. MBS down 10 ticks (.31) and 10yr up 7bps at 4.456
- 04:56 PM Heading out near the weakest levels with MBS down 3/8ths and 10yr yields up 8.6bps at 4.471

Lock / Float Considerations

- The week began with an unexpectedly robust temporary truce in the US/China trade relationship. This had the rather simple impact of juicing stocks and hurting bonds. Some traders expect this to be a one-day affair while others can't make a strong case to buy bonds until we know more about economic impacts and inflation. The jury is out until it's in. On more immediate, tactical note, this week's inflation data presents an asymmetric risk with lower readings likely to be dismissed as "too soon to see the tariff impact" and higher readings confirming that tariffs are already doing damage. The caveat is that this logic is obvious enough that it may already be fully priced in.

Technicals/Trends in 10yr (why 10yr)

- Ceiling/Support (can be used as "lock triggers")
