Complete Recap of Today's Market Activity

Big Shift Toward 5.0 Coupons Continues

Market Summary: Wednesday, September 17, 2025 - 8:43AM

Mortgage rates have lurched rapidly lower in September as 5.0 UMBS have stolen the show from 5.5 UMBS. As a reminder, there is only a certain range of rates allowed in either bucket. 5.5s go all the way up to 6.625% and investors buying MBS would prefer not to get stuck holding a burning bag of 6.625% loans in a market where those borrowers are already on the edge of being in the money on a refi. Bottom line, it's the fastest/biggest shift in 5.0 outperformance since late 2023, and today's installment brought the spread between the two coupons to the tightest levels since early October 2024. Lo and behold, that's the last time rates were in this territory. Spreads spiked back to wider levels on October 4th owing to a strong jobs report. This October's jobs report will be in focus for similar reasons, but before that, near-term volatility risks surround Wednesday's Fed dot plot.

Down Over an Eighth From AM Highs

The only downside of this morning's post-data recovery was that it set a higher level for MBS during some lenders' rate sheet print times. From those highs around 9:45am, MBS are now down 5 ticks (.16) despite being down only 1 tick on the day.

The jumpier lenders who released rates at or shortly after 9:45am could technically justify a negative reprice assuming they passed along the gains that were present at the time. In other words, if the lender in question posted rates that were the same as yesterday afternoon's, the risk would be fairly minimal.

Mortgage Rates Near 3 Year Lows Ahead of Fed

dropped sharply lower today relative to the amount of movement in the underlying bond market with the average lender right in line with the lowest levels since late 2022. Because rates are directly tied to the prices of those bonds, the correlation tends to be almost perfect over time.

[thirtyyearmortgagerates]

But there are always scattered examples of one leap-frogging the other. These inconsistencies can arise for several reasons. In today's case, it happened due to late-day strength in bonds yesterday afternoon coupled with the structure of the underlying mortgage bond market.

An explanation of the latter would be woefully esoteric in the context of a daily mortgage rate update--even for industry professionals. In the simplest possible terms, it has to do with the range of allowed in each grouping of mortgage backed securities (MBS). As investor sentiment shifts in favor of the next lower grouping, it effectively greases the skids for rates to slide down into the range associated with that grouping.

The overall set-up is reminiscent of September 2024 when rates were doing the same thing for the same reasons ahead of Fed meeting with a virtual 100% chance of a rate cut. Back then, mortgage rates moved paradoxically higher after the Fed rate cut. The same thing could happen this time, but it's by no means guaranteed.

In fact, last year's Fed rate cut wasn't the catalyst for rising mortgage rates. Instead, it was an upbeat shift in economic data in early October. In other words, rates will take their next major cues from incoming economic data over the next few weeks.

That said, tomorrow could still be a volatile day due to the Fed's quarterly update of each member's rate outlook (typically referred to as "the dot plot").

The Fed is Cutting Rates Next Week, But Not Mortgage Rates

Markets have settled into a cycle that favors the jobs report as the only critical economic data as far as rates are concerned. This week's inflation data had a chance to claim/preserve a role as a strong supporting actor, but instead, it basically stood aside and left focus on the labor market and the Fed's interpretation of recent labor market weakness. A majority of the notion of "recent lab...
