Complete Recap of Today's Market Activity

Unemployment Not High Enough For a Full-Fledged Rally

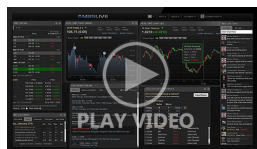

Market Summary: Tuesday, December 16, 2025 - 11:32PM

If the only metric from this morning's jobs report was the uptick in unemployment from 4.4 to 4.6%, and if that was the last of this week's big ticket econ data, it wouldn't be a surprise to see a more aggressive rate rally. As it stands, unemployment was tempered by a higher participation rate and less dire unrounded numbers (taken together, these actually made unemployment closer to unchanged). Add in stronger payroll growth, a surge in core retail sales, and the need to wait and see how Thursday's CPI comes out, and the choppy, lackluster rally is easier to reconcile.

Market Movement Recap

- 08:36 AM Modestly stronger after jobs report. MBS up almost an eighth and 10yr down 1.1bps at 4.165
- 09:27 AM Paradoxically modestly weaker now with MBS unchanged and 10yr up 1.3bps at 4.191
- 12:56 PM Back near best levels of the day. MBS up 5 ticks (.16) and 10yr down 2.1bps at 4.156
- 02:28 PM Leveling off at only modestly stronger levels. MBS up an eighth and 10yr still down 2.1 ticks at 4.156

Frustratingly Flat After Deceptively Friendly Jobs Report

If there was one metric in this morning's data that should be helping the bond market, it's the uptick in the unemployment rate from 4.4% in September to 4.6% in November (a new cycle high). This is mitigated somewhat by the uptick in participation rate (0.1%) and the slightly higher payroll count (64k vs 50k f'cast). In addition, BLS noted lower response rates for the household survey (unemployment rate) and a generally unknown impact from the government shutdown. Perhaps important is the fact that the unrounded unemployment rate only rose 0.13% versus the 0.2% rounded figure. Bond market volume has been predictably stratospheric, but the movement has been frustratingly flat. All in all, the jobs data simply confirms exactly what the Fed has been saying: modest ongoing weakness in labor market, but nothing catastrophic. It leaves room to focus on Thursday's CPI as policy-setting counterpoint.

Mortgage Rates Only Slightly Lower, But Volatility Risks Remain

There was a decent chance that rates would have made a fairly big move today in response to the release of November's jobs report. This is the most important economic data as far as rates are concerned and today's was the first full release since before the government shutdown.

In general, weaker employment data promotes lower rates and vice versa. While today's jobs report was weaker on balance, it wasn't weak enough to unequivocally shift the narrative of a labor market that is merely cooling in a gradual and manageable way.

The average lender moved back down to levels that were close to those seen last Thursday. In the bigger picture, rates are in a consolidation pattern inside the same relatively narrow range seen since early September.

MND 30yr Fixed Mortgage Rate Index

Volatility remains a risk as the week progresses. If there's one additional report the market may be waiting to see before trading today's jobs report more aggressively, it's this Thursday's Consumer Price Index (CPI). This is the heaviest hitting monthly inflation report and inflation is the other half of the Fed's rate-setting equation.

Once Again, Fed Rate Cut Was Meaningless For Mortgage Rates

Friends don't let friends believe the myth that Fed rate cuts result in lower mortgage rates. If you'd rather not immerse yourself in the "why," here is a solid "what:" This isn't an anomaly. The Fed Funds Rate governs loans that last less than 24 hours whereas a mortgage can last 30 years. Loans of different durations frequently see their interest rates walk vastly different path...
