Bouncing Back After Overnight Weakness

Market Summary: Thursday, October 8, 2026 - 2:28PM

Bonds were moderately weaker this morning in a move that followed oil prices and hawkish Fed comments. Chris Waller said more hikes were needed due to a strong economy, persistently high inflation, and the risk that inflation expectations would become unanchored after 5.5 years above target. This hit the short end of the curve at 4:30am ET and brought Fed Funds Futures for the middle of next year back to yesterday's levels. Oil prices were rising at the same time and were already pushing bonds higher (or the correlation is coincidental, and bonds just "felt like" correcting a bit). Starting around 9am, the long end of the bond market led a full correction back to positive territory. The absence of catalysts makes it look like dip-buying by big fund managers.

It's Time to Play "Name That Line"

Bonds were initially moderately weaker this morning in a move that followed oil prices and Fed comments. Chris Waller said more hikes were needed due to a strong economy, persistently high inflation, and the risk that inflation expectations would become unanchored after 5.5 years above target. This hit the short end of the curve at 4:30am ET and brought Fed Funds Futures for the middle of next year back to yesterday's levels. Oil prices were rising at the same time and were already pushing bonds higher (or the correlation is coincidental, and bonds just "felt like" correcting a bit).

In the last few minutes, 10yr yields made it all the way back to unchanged for reasons unknown, although someone will try to tell you it had to do with Europe and the ongoing bond market volatility there. They're wrong in this case even though Europe has been a factor on several recent occasions.

Now it's time to play "name that line." The following chart has 3 lines. One is the 10yr yield. One is oil. One is the implied yield for Fed Funds Rate in June 2027. See if you can guess which is which. Well, nevermind. It doesn't really matter, right?

Seriously though, the "Waller" caption gives it away. The orange line has to be Fed Funds Futures because it's not nearly as active as the other two (if you didn't already know, there are far fewer trades in Fed Funds Futures than in bonds or oil). The blue line therefore has to be 10yr yields. Well, it doesn't HAVE TO be, but it's much more likely to be because it moves with Fed Funds Futures whereas the red line does not (i.e. Fed rate outlook is more likely to correlate with the rest of the bond market than with oil prices).

UPDATE: Back Into Positive Territory After 10yr Auction

MBS MORNING: No Surprise: It Was a Trap

Today's Mortgage Rates

30YR Fixed	7.55%	-0.04%	15YR Fixed	7.20%	-0.02%	10/8/2026
------------	-------	--------	------------	-------	--------	-----------

Mortgage Rates Started Much Higher But Almost Fully Recovered

It was an exciting day for , and while we technically ended up slightly higher, it could have been much worse. In fact, it WAS much worse earlier in the day, but only for about 30 minutes.

Our daily rate index can be updated throughout the day if mortgage lenders change their rates in sufficient numbers. If we reported only the day's opening rate sheets, top-tier 30yr fixed rates would have been over 7.7%.

Almost immediately after those initial rates came out (around 9:30am ET), the bond market started to recover. By 11am, multiple lenders had already improved. There was an additional round of improvement in the afternoon with almost every lender dropping their rates at least once (many of them more than once) by the end of the day.

The net effect: today's average top-tier 30yr fixed rate rose only 0.03% versus yesterday to 7.59%--safely under recent highs.
