Complete Recap of Today's Market Activity

No "Yeah Buts" in Today's CPI. It's All Bad For Bonds

Market Summary: Tuesday, November 10, 2026 - 2:33PM

Some inflation reports have counterpoints even if they appear high at first glance. This one is just all-around not great for bonds. Really the only way someone could try to find a silver lining would be to say that month-over-month inflation moved a hair lower in a few key categories, but considering last month's report saw very high readings in those categories, that silver might actually be a lightning bolt.

Down Just Over an Eighth From Rate Sheet Print Times

Just a heads up for those of you whose rate sheets aren't substantially worse this morning. Some lenders apparently didn't price conservatively enough (the custom is to add a bit of extra pain to rate sheets on a day where bonds are sharply weaker after 8:30am data).

Officially, MBS are only down an eighth of a point from 9:35am ET. As such, a jumpy, early-pricing lender would only now be on the threshold of negative reprices. If your rates are already about an eighth of a point higher than yesterday, the risk is minimal unless we see additional selling.

MBS MORNING: No "Yeah Buts" in Today's CPI. It's All Bad For Bonds

ALERT: Down Over an Eighth Since 9:30am ET

Mortgage Rate Sharply Higher After Inflation Data

Rates enjoyed a remarkably calm winning streak over the past month with the worst single day resulting in a 0.06% increase for a top tier 30yr fixed loan and the average day seeing a 0.02% decline. That streak was dealt its first serious blow today following a hotter than expected in the Consumer Price Index (CPI)--a key inflation report.

Even though the Fed's official inflation target is based on Personal Consumption Expenditures (PCE), we'll be waiting another 2 weeks for that report to come out for the month of October. CPI (the one we got today) always comes out earlier in the month and because much of the data flows through to the more robust PCE data set, CPI reliably produces more volatility for the bond/rate market.

Today's report showed broad-based price pressures with only a small handful of categories seeing any improvements. Naturally, the categories most closely tied to higher fuel prices were the worst, but many non-fuel-related categories were surprisingly high.

Given that the Fed explicitly said it was more focused on the inflation component of its job description at the moment (as opposed to the "full employment" component), we were expecting today's data to carry far more weight than last week's jobs report. The reaction was logical an immediate. When the dust settled, the average top tier 30yr fixed rate was 0.12% higher day over day at 7.30%.

While that's the largest one day increase in over a month, it's still quite a bit lower than the 7.6%+ levels seen in early October.
